

Table 1: Tactics for equality and computation

what do you want to do?	tactic
compute	<code>simpl</code> , <code>cbn</code> , <code>cbv</code>
rewrite left to right with hypothesis H	<code>rewrite</code> H
rewrite right to left with hypothesis H	<code>rewrite <-</code> H
replace <code>t</code> with <code>t'</code>	<code>replace t with t'</code>
change the goal to a definitionally equal <code>G'</code>	<code>change</code> <code>G'</code>
substitute all variables equated in the context	<code>subst</code>
use reflexivity of equality	<code>reflexivity</code>
use symmetry of equality	<code>symmetry</code>
use transitivity of equality	<code>transitivity t</code>
use the compatibility of functions with equality	<code>f_equal</code>
use distinctness of different constructors	<code>discriminate</code>
use injectivity of constructors	<code>injection</code>
automatic reasoning with equalities by congruence closure	<code>congruence</code>

Controlling where to apply a tactic

- in the goal: no options.
 - `simpl`
 - `rewrite` H'
- in hypothesis H: `in` H.
 - `simpl in` H
 - `rewrite` H' `in` H
- everywhere: `in` *.
 - `simpl in` *
 - `rewrite` H' `in` *
